MAGIC FOREST

Game Design Document (GDD) | Assignment 8–9 | 5 November 2026

1. Title + one-sentence pitch

Magic Forest is a fantasy mobile platform adventure where a heroine explores enchanted forests, collects coins, avoids creatures and confronts a powerful boss.

2. Genre · platform · orientation

Genre: 2D fantasy platform adventure. Target: mobile Android/iOS. Orientation: landscape; playtesting conducted in the Unity Device Simulator.

3. 2D or 3D

2D: sprite-based characters, platforms, foreground/background art and a layered fantasy-forest environment.

4. Core gameplay loop

Explore → Jump and avoid hazards → Collect coins / defeat enemies → Reach the exit → Advance. The final forest introduces a boss encounter.

5. Controls and interface

Control / screen	Function
On-screen joystick	Moves the heroine horizontally.
JUMP / FIRE	Jumping; firing where the shooting action is available.
PAUSE / CONTINUE	Pause freezes game time; Continue resumes the current play session.
RESTART / MAIN MENU	Reloads the level; returns to the main menu scene.
Main menu / HUD	Title and Play/Quit; hearts/health, boss health where relevant, a planned score/coin counter, and controls.

MAGIC FOREST · GDD

Scope, production plan and the minimum viable game

6. Content

Three playable forest scenes: Forest_Level1 (introductory movement and coins), Forest_Level2 (platforms and enemy challenge), Forest_Level3 (boss fight and combat controls). Content shown in the project includes coins, platforms, environmental obstacles, enemies, magical exits, player hearts and a boss health bar. Exact enemy/item totals may change during polishing.

7. Art and sound

Art direction: dreamy, magical forest; colorful sprites, foliage, glowing objects, floral fantasy buttons, and distinct forest palettes. UI decorations were created with AI assistance and integrated manually; other sprites and audio are project assets whose source/license information should be documented before publication. Sound: background music and gameplay audio through Unity audio components; final audio balance remains a test item.

8. MVP — required for the Week 15 build

A start-to-finish three-level 2D mobile game with reliable movement/jump (and fire when needed), coin collection, enemies, a boss encounter, health, victory/defeat behavior, a functioning main menu, readable HUD, working pause/continue/restart/menu buttons, and usable landscape controls on 16:9, notched-phone and 4:3 tablet screens.

9. Cut list — intentionally outside the MVP

No online multiplayer, character customization store, open-world map, cloud account system, or additional levels beyond the current three. These ideas are excluded to prioritize a stable mobile game.

10. Development plan — Weeks 9–13

Week	Deliverable / checkpoint
9	Define GDD, game scope and GitHub workflow; consolidate the original mobile game.
10	Implement main menu, HUD and pause; add Safe Area and test three screen shapes.
11	Refine enemy/boss AI and validate damage, health and level progression.
12	Improve audio/effects and introduce or verify save/progression behavior.
13	Polish playability, fix UI/console errors, test builds and prepare evidence.

Project role: Solo student developer through Week 13; responsible for design, Unity integration, testing, documentation and version control. Contributors may review GitHub changes without forming a formal game development team.
